

TAKE-AWAY BOX

Properties list:

- biodegradability and compostability
- carrying system
- disposable packaging
- range of products
- concept
- soups and ready-meals
- box
- cardboard and paper
- eco-friendly

Take-Away Box is a viable alternative to aluminum or plastic cups that are commonly used in delicatessens and restaurants.

The basic element used to produce it is a multi-layer card of pure cellulose completely covered with a polyethylene film suitable for contact with food, which guarantees impermeability and protection. The film also allows the composition of the container through a mechanical process without using glue, staples or adhesives. The "TakeAwayBox" is composed of a single sheet of cardboard polythene which is ingeniously folded to create a closed container where the cup and the cap are integrated.

The main features of this product are the reduction of components and material and its complete recyclability.
